Site Notes:

Reduction of parking (already limited) would be required. Bioretention would rely on surface overflow, and underdrains would daylight into stream corridor. Depth would be limited to underdrain daylight elevation and depth to water table. It is possible to increase a vegetated strip within the bioretention.
Site Notes:
Top of watershed contributing to downtown infrastructure issues. Greenstreet treatments to accommodate driveways, and on-street parking. Use traffic calming techniques with integrated stormwater treatment.
Site Notes:
Informal grass parking area to be converted to bioretention. Existing yard inlet can receive overflow, but is too shallow to tie to underdrain. Underdrains can potentially provide treated stormwater for irrigation re-use (although quantity of effluent will be nominal).
